

## RADIO SPECTRUM POLICY GROUP WORK PROGRAMME FOR 2020 AND BEYOND

### Executive Summary

The Joint Radio Company (JRC) welcomes the opportunity to respond to this consultation and its recognition of the need to develop a work item entitled “Role of Radio Spectrum to help combat Climate Change.” Member States are already actively supporting the spectrum needs of the Energy Utilities to deliver the critical Operational Telecommunications requirements of the sector and it is timely to see the RSPG engaging with the role of spectrum in Climate Change. European Economic Development is predicated on robust and resilient energy supplies – for an increasingly dynamic energy supply system communication networks will have a crucial role in balancing supply and demand and ensuring stability of the energy networks. This functionality will be enabled by the widespread deployment of active, resilient control systems with data communications capability key to managing these energy flows. To this end, secure and expanded access to radio spectrum for Energy Utility Networks will become a critical component of their future operating model to enable the ‘Smart Grid’ that will be central to the ambitions of European Governments to combat climate change and deliver against the net zero emission pledges which have been made. Spectrum access should not be a blocker to the climate change ambitions of Member States.

### Background

Joint Radio Company Ltd is a wholly owned joint venture between the UK electricity and gas industries specifically created to manage the radio spectrum allocations for these industries which are used to support operational, safety and emergency communications.

JRC manages blocks of VHF and UHF spectrum for Private Business Radio applications, telemetry & telecontrol services and network operations. JRC created and manages a national cellular plan for co-ordinating frequency assignments for many large radio networks in the UK.

VHF and UHF frequency allocations managed by JRC also support telecommunications networks to keep the electricity and gas industries in touch with their field engineers. These networks provide comprehensive geographical coverage to support installation, maintenance and repair of plant in all weather conditions on 24 hour/365 days per year basis.

JRC’s Scanning Telemetry service is used by radio based Supervisory Control And Data Acquisition (SCADA) networks which control and monitor safety critical gas and electricity industry plant and equipment throughout the country. These SCADA networks provide resilient and reliable communications at all times to unmanned sites and plant in remote locations to maintain the integrity of the UK’s energy generation, transmission and distribution.

JRC supports the European Utility Telecommunications Council’s Radio Spectrum Group and participates in other global utility telecom organisations. JRC participates in European Telecommunications Standards Institute (ETSI) working groups developing new radio standards and European telecommunications regulatory groups and workshops.

JRC also manages microwave fixed link and satellite licences on behalf of the utility sector.

JRC works with the Energy Networks Association’s Future Energy Networks Groups assessing the ICT implications of Smart Networks, Smart Grids & Smart Meters and is an acknowledged knowledge source for cyber-security in respect of radio networks.

# JRC's Observations on the RSPG Draft Work Programme

## Introduction

JRC focuses its response on the proposal to establish a work item targeted at the “Role of Radio Spectrum Policy to help combat Climate Change”. Our response is informed by the needs of the European Electricity and Gas Energy Network Operators where the changing supply / demand context is requiring the industry to adjust their operating model to ensure that their networks can be dynamically controlled – such increased functionality is subject to the deployment of enhanced operational telecommunications capability which is dependent on spectrum access.

## Spectrum's Role in Supporting the Energy Networks of the Future

Historically energy networks have largely been passive networks with active control components limited in number and at the High Voltage layer. The telecommunications systems used have typically been narrowband and as such employed relatively limited amounts of spectrum. However, as energy networks become more dynamic both from a supply and demand perspective, i.e. distributed generation / storage and also the adoption of Electric Vehicles, there is an enhanced need to actively control the energy networks. This will result in control components being deployed within the Medium and Low Voltage layers with the number of active units increasing by several orders of magnitude. This significant increase in connected assets and resulting dramatic increase in data flows will lead to a significant expansion in the need for spectrum access to underpin these critical communications. The role of spectrum in supporting ‘Smart Energy’ has been acknowledged in a recent ECC article<sup>1</sup>. In addition, recent actions of National Regulatory Authorities<sup>2,3</sup> to facilitate spectrum access for ‘Smart Grid’ developments recognises this need. Moreover, it is worth reflecting on the basis for the spectrum award in the Republic of Ireland with extracts<sup>4</sup> from the consultation process which resulted in the award reproduced below;

- 3.27 Smart Grids are a key component of government efforts to meet demand for increased energy requirements in a cost effective and secure way while reducing the environmental impact of consumption and associated carbon emissions. Different functions of the Smart Grid could provide substantial reductions in energy use and carbon emissions by using new technology and making renewable energy and efficiency programs more affordable and potentially more accessible.
- 3.28 In particular, greater integration of renewable energy into electricity and gas grids is key to lowering the environmental impacts of generation and meeting climate change targets. For example:
- The ITU has outlined how Smart Grids can help to mitigate climate change by building more controllable and efficient energy systems;
  - The United Nations (UN) has outlined that the demands of climate change requires the development of a Smart Grid which is founded upon communications

networks that can deliver centralised real time monitoring and control, eventually across the entire power distribution domain.

- 3.29 A number of seminal international and national studies have estimated the potential carbon reductions arising from the use of Smart Grids:
  - the Electrical Power Research Institute (EPRI) has estimated that Smart Grid enabled electrical distribution could reduce electrical energy consumption by 5% to 10% and carbon dioxide emissions by 13% to 25%;
  - a smart electrical power grid could decrease annual electric energy use and utility sector carbon emissions by at least 12% by 2030; and
  - the Sustainable Energy Authority of Ireland estimates that by 2050, Smart Grids will see an accumulated reduction in energy related CO<sub>2</sub> emissions of 250 million tonnes.
- 3.30 At a European Level, the European Commission has been encouraging the use of Smart Grids in order to encourage more efficient energy generation and consumption. For example, under the Electricity Directive:
  - *“Member States should encourage the modernisation of distribution networks, such as through the introduction of **smart grids**, which should be built in such a way that encourages decentralised generation and energy efficiency.*
  - *“In order to promote energy efficiency, Member States or, where a Member State has so provided, the regulatory authority shall strongly recommend that electricity undertakings optimise the use of electricity, for example by providing energy management services, developing innovative pricing formulas, or introducing intelligent metering systems or **smart grids**, where appropriate.*
- 3.31 The European Commission has an existing policy framework for climate and energy from 2020 to 2030 which proposes new targets and measures to make the EU's economy and energy system more competitive, secure and sustainable. It includes targets for reducing greenhouse gas emissions and increasing use of renewable energies noting that *“the EU and Member States will need to develop further their policy frameworks to facilitate the transformation of energy infrastructure with more cross-border interconnections, storage potential and **smart grids** to manage demand to ensure a secure energy supply in a system with higher shares of variable renewable energy”.*
- 3.32 In that regard, at a national level the Department of Communications, Climate Action and Environment is currently developing a National Energy and Climate Plan (NECP) as one of the key provisions of the proposed Governance of the Energy Union Regulation. The plan, which is due to be submitted to the European Commission by the end of 2018, will include trajectories for renewable energy, energy efficiency, and national emissions, and measures required to achieve these trajectories. The plan must set out how Ireland is going to achieve targets on reducing carbon emissions and increasing renewable energy up to 2030. The then Minister for Communications, Climate Action and Environment, Denis Naughten T.D noted that this will be facilitated by existing work streams such as the National Development Plan (NDP). The NDP includes measures such as Smart Grid to transition to a low-carbon economy.
- 3.33 Such requirements are also broadly in line with State policy to encourage the provision of Smart Grid and other related technologies. For example:
  - The Project Ireland 2040 National Planning Framework promotes a transition to a low carbon energy future which requires decisions around development and deployment of new technologies relating to areas such as wind, **smart grids**, electric vehicles, buildings, ocean energy and bio energy.
  - It also commits to a roll-out of the National Smart Grid Plan enabling new connections, grid balancing, energy development and micro grid development.
  - The Department of Communications, Climate Action and Environment National Mitigation Plan observes that smart operation of the power system at both

transmission and distribution level and energy efficiency will enable maximisation of the existing grid.

- The National Development Plan 2018-2027 foresees the piloting of “climatesmart countryside” projects to establish the feasibility of the home and farm becoming net exporters of electricity through the adaptation of smart metering, smart grids and small-scale renewable technologies, for example, solar, heat pumps and wind.
- The Sustainable Energy Authority of Ireland “Smart Grid” Roadmap to 2050 notes that Smart Grid can maximise our use of indigenous low carbon renewable energy resources which is central to ensuring Ireland meets its long term target of a secure and low carbon future.

This strategic intervention by ComReg and the Irish Government to acknowledge and facilitate spectrum access for Smart Grid developments to address climate change objectives has been informed by a thorough appraisal of the changing energy supply-demand context.

This context is not unique to the Republic of Ireland but is playing out across Member States. For example, the German utilities<sup>5</sup> have requested spectrum access, whilst in the UK there is an ongoing study underway by Ofcom to consider the spectrum access needs of the UK Energy Utilities. Hence, we are pleased by the RSPG’s proposal to establish a work item, ‘Role of Radio Spectrum Policy to help combat Climate Change,’ but at the same time encourage the RSPG to give this the appropriate priority to reflect the commitments being made by Member States to a net zero future and prevent spectrum access being a blocker to their climate change ambitions.

---

<sup>5</sup> 200 utility companies in Germany have called for the opening of award procedure for 450MHz spectrum by the Federal Network Agency, <https://www.bdew.de/presse/presseinformationen/offener-brief-der-energie-und-wasserwirtschaft-zum-dringenden-bedarf-zuteilung-der-450-mhz-frequenzen/>
